The repositories group are not supported natively by RhodeCode due to how webdav works. A work-around solution is to define multiple paths in the apache configuration based on repositories groups.

example:

```
<VirtualHost *:8090>

    ## ... rest of configuration here

    <Location />
        DAV svn
        # Must be explicit path, relative not supported
        SVNParentPath /home/ubuntu/repos/
        SVNListParentPath On
        Allow from all
        Order allow,deny
    </Location>

    ## each repository group needs to have a separate entry
    <Location /example-group>
        DAV svn
        # Must be explicit path, relative not supported
        SVNParentPath /home/ubuntu/repos/example-group
        SVNListParentPath On
        Allow from all
        Order allow,deny
    </Location>

</VirtualHost>
```
