Description			
<p>When trying to import a git repository with a URL in the format "git://git.abc.com/project" I get the error message: "Invalid clone url, provide a valid clone url starting with one of http,svn+http,hg+http" Going a git clone on the same repository works fine from the command line. Please could you enable support for these remote repositories?</p> <p>(PS. It is possible to do the git clone git://git.abc.com/project manually to import the repository while waiting for this feature?)</p>

Hi,

We're sorry but we wont support cloning over git:// protocol. RhodeCode needs to rely on fastest, and secure protocol which is https. The git://protocol doesn't allow authentication, and is only meant for cloning.

To import repositories to RhodeCode you can simply clone a bare repos into rhodecode storage, and run remap & rescan from admin > settings. This will pick up any repositories added into the storage directory.
