Description

I'm currently working on getting Rhode Code CE setup with SSH and have followed the instructions on the following page:
<https://docs.rhodecode.com/RhodeCode-Enterprise/auth/ssh-connection.html>

When I try and run "hg push" from the client I get the following error:

```
remote: bash: hg: command not found
abort: no suitable response from remote hg!
```

Installing mercurial on the machine removes this error, but then doesn't know where the repo is located on the server. Everything seems to work great over http. Did I miss a step, is there something missing from the docs, or is this a bug?

Thanks!
Nathan

Hi,

Yes there seems to be a problem with setting binaries that are shipped with vcserver.

Please edit vcserver.ini and make sure this is set inside:

```
core.binary_dir = /home/YOUR_USER/.rccontrol/vcserver-1/profile/bin
```

But this is odd, because the enable-module should have set it.

Thanks for the quick response!

Unfortunately this doesn't seem to be the issue as this setting is correct. Just to be sure I copied the path from the vcserver.ini and ran:

```
/home/rcuser/.rccontrol/vcserver-1/profile/bin/hg --version
```

and got the appropriate version info.

Is it possible the setting isn't getting applied somehow?

Hmm, something is odd then.

1) maybe there are some hooks on this repository?

2) did you tried to enable debug as in note after pt4 in <https://docs.rhodecode.com/RhodeCode-Enterprise/auth/ssh-connection.html>

Thanks for your help Marcin. It turns out it was something dumb on my end. I had made it so I could ssh into the server as the my Rhode Code user (rcuser in my case). It seems this was conflicting with Rhode Code.
