Description

Timestamps for changes in repository/repository list is incorrectly handled.

Have seen this on both on-prem instance and on code.rhodecode.com.

It appears time is converted to UTC and timezone delta discarded when computing age, and later server locale is shown on hover.

On-prem I have seen this manifested as age being the entire timezone delta to our locale.

Timestamps/age are shown correctly in the repository summary and under admin/repositories

(though consistency between the way timestamps are shown all over the place would be welcome)

(The easy workaround is probably to switch server to UTC)
