Description			
<p>Currently trying to implement an SSH key based workflow and have been informed by support that Rhodecode EE SSH clone module does not support cloning by repo id, only by repo name. This would seem to be inconsistent with the rest of Rhodecode, especially since as an admin I am able to change the clone URL template for SSH to use reposit, which will never work.</p> <p>Is it possible to add support to the SSH clone module for reposit, rather than just repo name?</p>
